

Dear Hiring Team,

I'm writing to express my strong interest in the Infrastructure Engineer position at Semgrep. As a software engineer with two years of experience architecting and operating production cloud infrastructure at scale, I'm excited about the opportunity to help build the robust platform that powers Semgrep's security products and enables developers to move fast and stay secure.

At Eden, I owned the full infrastructure lifecycle of a healthcare platform managing 250+ AWS resources across 18 CloudFormation stacks. This experience directly aligns with Semgrep's infrastructure mission: I designed and deployed distributed systems that were secure, reliable, and performant. I built infrastructure-as-code using AWS CDK, implementing HIPAA-compliant security validation with CDK-Nag, comprehensive testing with 85% coverage, and automated CI/CD pipelines that enabled rapid iteration without sacrificing stability. I also engineered auto-scaling policies, circuit breaker patterns, and retry logic with exponential backoff to maintain high availability while optimizing costs—core SRE practices that align with your on-call rotation and reliability focus.

My infrastructure foundation is solid, as I've architected complex service architectures spanning Lambda, EC2, DynamoDB, VPC with NAT gateways, API Gateway, and managed services across multiple AWS regions. I implemented comprehensive monitoring with CloudWatch dashboards, SNS notifications, and custom metrics, enabling proactive incident prevention and rapid debugging. I also designed and managed disaster recovery strategies, implemented secure credential management via Secrets Manager, and led database and service migrations; all experiences that translate directly to the critical infrastructure component upgrades and strategic migrations mentioned in the position listing.

What excites me most about Semgrep's Infrastructure team is the opportunity to build platforms that directly enable developers to ship better code faster. At Eden, I viewed infrastructure as the foundation for delivering the best product and services for our users. I drove adoption of infrastructure best practices by mentoring team members. I'm eager to bring that mindset to Semgrep, where infrastructure decisions impact millions of developers across your platform.

On the learning side, while my infrastructure experience is in AWS, I've developed and practice a rapid learning approach that's allowed me to master new technologies quickly, a skill that I had to put into practice almost daily as a founding engineer. I'm eager to deepen my Kubernetes expertise alongside your team and become a subject matter expert in both Kubernetes and AWS administration. This is the type of specialized skills that take on outsized importance in a scaling infrastructure organization.

I'm drawn to Semgrep because your mission to empower developers to build securely without friction. This mission resonates with my philosophy that great infrastructure should be invisible to users, allowing the product's benefits to be realized without friction. I'd welcome the opportunity to discuss how my experience building secure, reliable, and performant infrastructure can help Semgrep scale as the leader in code security.

Sincerely,

Marcus Roldan
