

Dear Hiring Team at UHF,

I am writing to express my interest in the Data Analyst role at United Hospital Fund. With healthcare technology experience at Eden and Wishroute, I enjoy turning complex operational data into reusable, scalable datasets and dashboards that support both technical and non-technical team members, as well as mission-driven stakeholders.

At Wishroute, I led the internal analytics project from the ground up as a software engineer intern. I migrated useful data from non-SQL to SQL architecture, integrated with visualization and dashboard tools, and translated stakeholder needs into modular, reusable SQL query logic and dashboard visualizations. To facilitate this project, I met extensively with non-technical team members to brainstorm and refine the questions they wanted answered, define the cadence for reviewing metrics, and then built reproducible reports that non-technical users could execute independently.

I also have hands-on ETL pipeline experience from several projects, including one where I fed existing data structures into an ETL pipeline for usage downstream in a containerized SQL server. To facilitate data analysis I developed of premade queries for non-technical users alongside a CLI tool for technical users to perform ad-hoc analysis. These workflows helped ensure data readiness, repeatability, and self-service access for both technical and non-technical audiences.

At Eden, I led technical discussions in the healthcare field, organizing business needs, regulatory requirements, and data standards into a scalable, modular architecture for our core backend product. That role required translating healthcare integration patterns into clean service boundaries, designing data flows that supported patient, provider, and insurance workflows, and ensuring the architecture could evolve alongside compliance and operational needs.

I am especially drawn to UHF's Medicaid and HRSN work because it aligns with my experience making messy healthcare data workable. I enjoy architecting SQL transformations that clean and aggregate high-volume records, and I am committed to reproducible workflows through Git, documentation, and code review. I also have experience translating backend data into visualization ready outputs and technical narratives for non-technical audiences, which is essential when the goal is equitable health policy and service delivery.

I would welcome the opportunity to contribute to UHF's data infrastructure, helping bridge raw Medicaid and administrative data into analytic datasets that drive quality improvement and equity outcomes for New Yorkers.

Sincerely,

Marcus Roldan
